a(n) = a(n-2) + a(n-3) - a(n-5).
a(n) = 3*n - (n mod 2) - (n mod 3). More generally, it is easy to see that Sum_{i=1}^k i*floor(n/i) = k*n - Sum_{i=1}^k (n mod i).
a(3*m + r) = 9*m + r^2 - (1-(-1)^m)*(-1)^r/2, with r = 0, 1 or 2. Therefore: for even m, a(3*m + r) = 9*m + r^2; otherwise, a(3*m + r) = 9*m + r^2 - (-1)^r.

a(n) = 3*n^2 + 3*n + 1. Proof: 1) If n occurs once, it may be in 3 positions; for the two other ones, n terms are independently possible, then we have 3*n^2 different triples. 2) If the term n occurs twice, the third one may be placed in 3 positions and have n possible values, then we have 3*n more different triples. 3) The term n may occurs 3 times in one way only that gives the formula. - Philippe Lallouet (philip.lallouet(AT)wanadoo.fr), Aug 20 2007
